

One-Touch Segmentation

Automatically protect all your cloud and on-premise workloads with an adaptive security strategy. No policies required.

Apply and enforce the strongest, fastest, and most dynamic security available with little to no human intervention.

Existing solutions require months of machine learning, application discovery, and segmentation policy creation. This can be an extremely expensive and tedious process, especially for small or growing companies with dynamic workloads.

Eliminate the pain of manually building policies with long deployment cycles, wasted SoC hours, and more by using one-touch segmentation. Strengthen your critical assets and secure your data across any platform by building out a dynamic, robust security strategy with Avocado. If you need more control, full programmability is available for creating custom policies with labels, access levels, compliance, separation, and more.
