VITALCLOUD

About

Vitalcloud provides high level nurse call system management in real-time including reporting, performance analytics, system configuration and maintenance. It can be cloud or facility based and is most suitable for hospital, aged and retirement care facilities.

Vitalcloud can be accessed through a smartphone application or browser.

> **"Vitalcloud gives me the essential real-time data I need to manage my facility, accessible anywhere from any device. It is an essential management tool that helps me do my job better."**
>
> **— Facility Manager**

Vitalcloud Features

Dashboard
View critical site information on the real-time dashboard. Understand key facility metrics such as call response times and system status.

Configuration
All devices such as call points, over door lights and LCD displays are configured through Vitalcloud, along with criteria for specialist solutions such as dementia care, RTLS and patient activity monitoring (PAM).

Reports
All activity on the nurse call system is logged and a range of standard and customised reports are available. These can be produced as required, or scheduled to email.

Maintenance
A maintenance module simplifies compliance and accreditation with a structured approach to testing, including providing an audit trail.

Support
System support and nurse call device software deployment can be carried out securely through Vitalcloud. This capability dramatically reduces service travel time and associated costs.

Lookahead
Predictive algorithms provide insight to future facility performance based on historical statistical analysis. Vitalcloud supports personnel work-load schedule management.
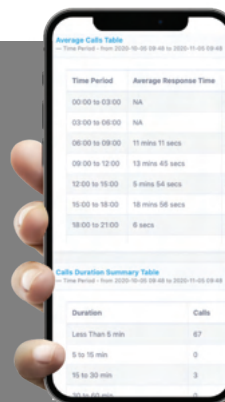

Device Location (RTLS)
Vitalcloud provides an interactive map of the facility with identified locations for all devices enabled with RTLS (Real Time Location Systems).

Secure
Password protected access with a range of user defined roles provides secure system management, with a choice of on-site or cloud hosting.
