

**DATE** 2/25/19

**SUBJECT** QuickFlight Harness requirements

**Introduction**

With the launch of the QuickFlight/QuickFlight XL products, Head Rush Technologies revised the harness requirements to only allow for full body harnesses.

**Background**

The change was to standardize on the use of full body harnesses as lighter weight participants typically require a full body harness due to their size and bone structure. Lighter weight participants (children) harnesses are sold the majority of the time only as full body harnesses.

**Future Changes**

We will change the user manual to add further clarity to this position and continue to allow for sit harnesses compliant to EN 813 or EN 12277 – Type C harnesses with the use of QuickFlight or QuickFlight XL products with participants which meet the criteria from harness manufacturers for weight capacity and size. This clarification will be added to the next revision of the QuickFlight manual. The correct size harness must be correctly worn by the participant and tightened as per the harness manufacturer’s instructions prior to being attached to the QuickFlight or QuickFlight XL.

Best regards,

**Richard Reynolds**
