MEDICAID MEDICATION THERAPY MANAGEMENT

Create a Higher Level of Care Management

GuidingCare® is one of the first population health platforms featuring a Medication Therapy Management (MTM) module dedicated to the Medicaid population. Medicaid members often have complicated health needs and use a greater number of medications. The GuidingCare Medicaid MTM module elevates pharmacists to active members of the care team, giving them a central location in which they can manage member medications and intervene to prevent potentially harmful outcomes.

STRENGTHEN TRANSITIONS IN CARE

MTM supports better management for transitions of care, which are points in the continuum of care when new medications are often ordered or existing orders are rewritten. Thanks to its integration with other GuidingCare modules, MTM gives non-pharmaceutical care team members and providers access to medication assessments and interventions that are important to care planning and better outcomes.

AVOID ERRORS AND REDUCE BARRIERS

Pharmacists can now track medications and avoid potentially harmful errors with this user-friendly application. They can monitor patient compliance, so barriers to care can be identified and mitigated by targeted interventions between providers and members.

MEDICAID MEDICATION THERAPY MANAGEMENT

Integrate Pharmacists into the Care Team

Medicaid beneficiaries often have complex and chronic health needs that require long-term medication therapies. The MTM module allows pharmacists to better manage this small subset of the population, which usually accounts for a greater share of the costs. By integrating pharmacists into the care team, critical medication assessments can be factored into the care plan to manage:

- Medication errors
- Drug-drug interactions
- Omissions
- Duplications
- Dosing errors
- Patient adherence
- Barriers to care
