

Global pharmaceutical corporation uses i-nexus to build and sustain its Operational Excellence

Background

This innovative biopharmaceutical company discovers, develops and delivers world-class consumer healthcare products, and with countless projects and innovations to manage, having centralized data to inform decision-making and promote best practice is paramount.

Challenge

Previously, the organization depended on Microsoft SharePoint to distribute information across the different teams, divisions and projects. Their strategic focus was on methodology, workflows and outputs, but the lack of a centralized platform made it difficult to realize these goals. Consolidating information and accessing it in real time was difficult and impacted the results of each project.

Solution

The organization required a solution which would help with:

- Data-driven reporting and forecasting
- Standardizing project management, with software capabilities to track progress, financials, risks, schedules and resources
- Operational Excellence and managing Lean Belt certification tracking
- Financial tracking across different units, with navigator views and transaction summaries

Benefits

Having introduced i-nexus, the organization now enjoys:

- A single source of information that delivers real-time information and statistics
- Enhanced communication and transparency of strategic goals
- Goal cascade down throughout the organization, with simultaneous tracking
- A clearer view on ROI for all new innovative processes and projects to illustrate their value to the wider organization

"Consolidating information across the whole organization impacted the results of each project, and inhibited the business' ability to establish best practice and roll this out across the different units which contributed to each project"
