

Data Catalog Connector for Product MDM

Accelerate your digital transformation journey

Establishing and growing a knowledge base to explain how to use your data management system can be a monumental task. Your system is configured to meet specific business requirements, and whether it's workflows, field names or properties, not knowing the purpose of an object can slow you down and increase the time for new users to work optimally. Stibo Systems' Product Master Data Management (Product MDM) solution offers a single and scalable data catalog, powered by an external wiki system to maintain consistency across your product data, support governance policies and establish a collaboration platform to enhance configuration governance across your organization.

The right knowledge at your fingertips

To support efficient governance, it is key to have the right configuration governance in place so that everyone in your organization can be in sync, as well as trust and understand your product information. Stibo Systems' Product MDM solution now puts this information at your users' fingertips. The data catalog is powered by XWiki, an advanced open-source enterprise wiki platform that focuses on content collaboration. Using the data catalog helps users to clearly understand key processes, such as configuration change requests, as well as the business purpose of objects and attributes.

Key features

- Centralize documentation for configuration objects such as workflows, user and user groups and attributes
- Use comments and other web features on the wiki pages' custom areas to collaborate between departments
- Create and update wiki page metadata area easily
- Search all content via the wiki typeahead search

Key benefits

- Describes how your system works and how to use it
- Enables configuration governance through wiki integration and captures metadata on system setup objects
- Documents the purpose of an attribute, integration endpoints or the process to request a change to a workflow
- Collaborate and continuously contribute additional information

Improve collaboration and traceability across your enterprise

The underlying Wiki technology promotes collaboration by using embedded comments, notifications, hyperlinks to intranet pages or multimedia plugins so users can keep up-to-date with any requests or changes in the wiki. Furthermore, since seemingly small mistakes can turn into something critical later on, the data catalog also provides the needed traceability to keep track of when changes were made and by whom.

Easily add and modify information to your wiki

Accessing the data catalog is straightforward. Launch the wiki directly from the Web UI, and easily search for content. Once your wiki pages are in place, authorized users can also make the necessary changes and updates. In addition, our Product MDM solution can support many other third-party wikis, in the event your system already uses an enterprise-wide wiki platform.

Access your wiki with just a couple of clicks.

Maintain traceability and accountability for any attribute.

Ensure accurate and current data by easily editing any part of your wiki.
