

Remediant **SecureONE**

Privileged Access Management Solution of the Year

CyberSecurity Breakthrough, an independent organization that recognizes the top companies, technologies and products in the global information security market, recently announced that Remediant's SecureONE platform has been named the winner of the "Privileged Access Management Solution of the Year" award from CyberSecurity Breakthrough.

“ James Johnson, managing director, CyberSecurity Breakthrough

It is exciting to see innovators such and Remediant drive change and improvement on this weak link, revolutionizing the category of Privileged Access Management beyond the password vault and into a new era of access across the enterprise. Congratulations to the Remediant team on their success with SecureONE and the well-deserved 2018 CyberSecurity Breakthrough Award designation.

”

JD Sherry, CRO

The simple truth is that passwords will be compromised, whether through phishing or countless other vectors, and our ongoing mission is to provide a new level of control and insight over the distribution, usage, and protection of privileged access across enterprise environments. With our SecureONE platform, the first non-password-vault based PAM solution on the market, we deliver that capability at scale, reducing the attack surface while also making it easy to assign privileged access via Just In Time Administration.

Paul Lanzi, COO & Co-Founder
paul@remediant.com

As IT practitioners ourselves, creating a solution that was easy to roll out and maintain was critical. SecureONE achieves that objective by being agentless, integrating well with other IT Security solutions and providing protection with the first endpoint enrolled. We are proud to accept this CyberSecurity Breakthrough designation in recognition of our agile, easy, solution to PAM.

Remediant delivers on our promise of Securing Innovation through market-leading cybersecurity products. Our flagship product, SecureONE, brings CISOs, Data Center Managers and IT Security professionals the control and insight they need over privileged access – the #1 attack vector in security breaches. Built by IT Security professionals for IT Security professionals, SecureONE stops lateral movement and continuous monitoring of privileged access changes, while providing deep audit logging and unparalleled usability.

Hard Data

In September 2018, Enterprise Management Associates conducted a survey of 150 enterprise IT teams, examining their use of Privileged Access Management technology.

In addition to naming Remediant a Top 3 Privileged Access Management provider, the survey revealed surprising details about how enterprises are, and are not, using PAM technology today.

Discovering Privileged Access

Have deployed other PAM:

32%: Extremely Time Consuming

Have not deployed any PAM:

4%: Extremely Time Consuming

At least 'somewhat concerned' about undiscovered / unmanaged privileged access use:

Question: How time-consuming is (or would be) discovering privileged access for administrators in your organization? (comparing adopters to non-adopters)

Conclusion: Enterprises that have deployed a PAM solution believe that Discovering Privileged Access is 8x harder than enterprises who have not rolled out a PAM Solution.

Remediant solution: Automatic, continuous discovery of privileged accounts is key. SecureONE can discover privileged accounts on thousands of Windows, Mac and Linux systems in minutes.

Just-In-Time Privileged Access

Have privileged access vs need it:

35%: Need it

61%: Have it

On average...

- » Administrators receive requests to elevate a user's privileges between **once and twice** per day
- » Actual temporary privileged access duration **exceeds planned duration by >2 hours**
- » 41% of privileged access policy violations are due to the **access duration being longer than permitted**

Conclusion: Assigning privileged access rights on a just-in-time basis, with the shortest possible duration, will reduce policy violations and significantly improve security.

Remediant solution: Just-in-time Access (JITA) delivers usability and security improvements, while making access easy to obtain when it's needed.
