

CHEMEX 33 GTC - Commercial Drain Line & Grease Trap Cleaner

Dosing Instructions for Grease Trap & Commercial Drain Lines

- For best results, initially shock the Grease Trap with 16-32 oz., directly into the trap.
- Pour 8-10 ounces of product per 2 inch diameter pipe, into the main line at 3-bay sink, dishwasher floor drain and any other opening that feeds to the Grease Trap; each day for one week
- Then dose 8-10 ounces of product in to same drain openings weekly, for one month.
- Then dose 8-10 ounces per drain on a monthly basis. (Continue to dose main line daily with 8-10 ounces, of Chemex 33.)
- All dosing should be performed when minimal water usage will occur.

The dosing instructions are based on the minimum amount of product needed to properly improve slow moving drains caused by FOG (Fat, Oil and Grease). Chemex 33 will also remove sludge and eliminate the foul odor in the drain lines and grease traps. In most cases, results are evident within 5-7 days from initial treatment. Please allow 30 days for maximum performance. Increase dosage in extreme situations, for best results.
