

Harmful Biologic Aerosols

It is widely established that drains are reservoirs for microbes and antibiotic residues. It is also clear that microbes in drains and pipes adhere to the surfaces of drains and drainage pipes as microbial biofilms, creating a complex ecosystem of different microbes that are fed by organic and inorganic matter. Drains act as cradles to the emergence of bacteria armed with abilities to resist multiple antibiotics. The development of resistance is probably enhanced at hospitals due to the fact that more bacteria and more antibiotics are flushed down the drains due to the very nature of hospitals constantly caring for numerous different patients that are ill and treated with antibiotics.

Thus, biofilm in building drains, not properly maintained, have the potential of spreading even more resistant bacteria. Numerous studies stress the importance of a physical barrier between drainage systems and surroundings. As shown in the SARS outbreak at Amoy Gardens, harmful biologic aerosols can enter the ventilation system from exposed drains and be spread to all the other connected rooms igniting a fearsome spread. It is essential that drainage systems must be completely tight and intact where openings have physical barriers.

The Green Drain can help to prevent potentially fatal cross contamination and infection spread caused by unprotected drains. The Green Drain is an economical Drain Trap Seal Device that allows water to flow down the drain while preventing Pests, Odors, and Harmful Gases/Pathogens from infiltrating the living or work space.

Prevents

Drain Odors
Pest Infiltration
Sewer/Radon Gas Infiltration
Harmful Biologic Aerosols

Product Benefits

Increases Indoor Air Quality
Protects the Public Health
Green Technology
Helps in LEED Certification

Product Features

One way drain valve
Ease of installation
Does not impair flow rate

Does not impair plumbing maintenance
Provides sewage back-flow protection
Universal Plumbing Code Certified
