

Food Safety Material & BPA Free Letter of Guarantee

Stand up pouches are made from multiple layers of barrier film. Each layer serves a purpose; odor or moisture protection, general barrier performance, and heat-sealing. Together all these layers are laminated/bonded together which create the stability for the pouch to stand effectively while protecting the product inside.

The inner-most layer is made with FDA, food grade film, LLDPE (linear low-density polyethylene). This layer is what comes in direct contact with whatever product goes into the pouch. Keep in mind; this is made from resin (tiny pellets). We buy only FDA approved LLDPE resin.

Step 1 Bulk Resin

Step 2 Resin is Heated

Step 3 Made into Film

The finished product is in roll form as LLDPE. Because we started with FDA food grade resin, in our very own controlled environment, we certify that this is food grade safe.

From our raw materials, through our production process and at all steps involved in the production & handling of our film for all the flexible packaging we produce, we confirm that our product and process has not been contaminated by Bisphenol A (BPA). Our products comply with specific migration limits of the plastic directive 2007/19/EC. (EU) No 10/2011 and Directive 2001/19/EC on plastic materials and articles intended to come into contact with foodstuffs or any other product in contact with our packaging.
