

## Increase productivity with improved connectivity

A secure, well-functioning network is at the core of your communities' IT experience for staff and residents alike. We deliver secure network access, circuit management, router management, as well as wireless and wired network management to optimize uptime and ensure the availability of applications you rely on to run your business.

Unlike off-the-shelf equipment, vcpi networking solutions are a facility-specific design that meets HIPAA and HITECH standards with 24/7 network monitoring and support. In the case of wireless implementations we create multiple secure wireless paths to separate Internet traffic between residents and guests and your confidential business and health care information.

We begin the process with an assessment of your current network, as well as a recommended network design, conducted by one of our certified network engineers. We offer three options for this assessment tailored to meet the needs of your situation.

Network assessments are particularly important when it comes to wireless to ensure optimal equipment placement, maximize connectivity and power, and avoid areas of radio interference. This results in a secure and scalable wireless system that is designed and sized for consistent coverage that meets your immediate and long-term requirements.

With nearly two decades of experience focused on providing IT services to the LTPAC and senior living industry, vcpi has the expertise to design, implement, and manage the optimum networking solution for your facility.

## Your advantage

- Provide convenient internet access for residents, patients and guests
- Increased staff mobility and security to more productively provide care and maintain system operability and integrity
- Ability to leverage newer secure wireless technologies to more effectively compete in the continuum of care market
- Your choice of dedicated or shared wireless controllers to fit your investment parameters
- Protect against spyware, malware and viruses
- Procurement and installation of Cisco® wireless access points and switches using our extensive industry and technical expertise
- 24/7 system environment monitoring, diagnostics, and support
